

JAKE Axle Stabilizer

With the help of a **JAKE** Axle Stabilizer, a front axle oscillation can be locked by hydraulic cylinders in any axle positions. The **JAKE** Axle Stabilizer increases stability of a tractor-crane combination significantly. The Stabilizer is locked by an electric valve and the lock function can be connected to a handbrake so that the Stabilizer works automatically. Moreover the **JAKE** Axle Stabilizer can be locked by an override-switch so it is possible to lock the axle while a tractor is moving. In the off-position the Stabilizer does not make the axle oscillations slower and neither it limits an angle of the axle oscillation.
